Research Archive for Ancient Sculpture
University of Cologne
Albertus Magnus Platz
D-50923 Cologne

German Archaeological Institute
Podbielskiallee 69-71
D-14195 Berlin

- object database as free internet research tool

- all objects: comparable & contextual background

- retrieval of either general information or complex contexts of objects

- originally started as a database exclusively for ancient sculpture
- more objects of different categories and increased complexity needed higher request → decision: use of international web standards: TEI/ Dublin Core/ CidocCRM/ PMH/ XML
- Desire to support the open linked data web and to be part of different webportals such as Ariadne

efforts within three example projects:

1. **Emagines**:

   glas negatives digitized, implementend by using CRM and integrated in other web resources

2. iDAI.Bookbrowser, **Reception of Antiquity in a Semantic Network**: engraved prints from the 16th and 19th century visible and searchable by the TEI-Viewer offering meta-datas, OCR and further links

3. **The Berlin Sculpture-Network**:

online catalogue of the Antiquities Collection of the SBM with about

2,600 objects accessible and visible in arachne

Arachne in numbers:

- 1,7 milion images registered of which 1.400.000 are visible for everyone
- approximately 11.000 registered users can access 700.000 book pages in about 3.650 books as well as 220.000 objects and buildings and 20.000 topographies
- contextualisation given by approximately 3.200.000 relations between arachne records

Arachne is intended to provide archaeologists and Classicists with a free internet research tool for quickly searching hundreds of thousands of records on objects and their attributes. This combines an ongoing process of digitizing traditional documentation (stored on media which are both threatened by decay and largely unexplored) with the production of new digital object and graphic data. Wherever possible, Arachne follows a paradigma of highly structurized object-metadata which is mapped onto the CIDOC-CRM, to adress machine-readable metadata strategies of the Semantic Web. This »structured world« of Arachne requires high efforts in time and money and therefore is only possible for privileged areas of data. While on the ever-increasing range of new, digital born data in reality only a small effort-per-object ratio can be applied. It therefore requires a "low-threshold" processing structure which is located in the »unstructured world« of Arachne. All digital (graphic and textual) information is secure on a Tivoli Storage System (featuring long-term multiple redundandancy) and distributed online through the Storage Area Network in Cologne via AFS.

Contents of Arachne:

Simple search

This field allows you to enter keywords to search throughout the entire database.

Multiple keywords separated by spaces indicate an AND connection between the keywords (e.g. Hadrian Tivoli).
Place a minus sign in front of the keyword for a AND NOT combination (e.g. Athen -Akropolis).
In order to search for complete phrases, place these in quotation marks (e.g. "Gott aus dem Meer").

The result list also contains records in which the keywords only occur in linked records. This will become apparant and navigable in the individual records within the context browser.

Information on building

Localization:

Paestum, Ancient place name: Poseidonia / Paestum, Italien, IT
Ort im Gazetteer

Geographical description:

Der Tempel liegt im Athenaheiligtum im nördlichen Bereich der Stadt.

Ancient landscape: Kampanien

Cultural era: griechisch

Characterization:

Building type: Tempel, Peripteros

Preservation: Die Peristase und der Architrav sind noch erhalten. Es fehlen das Dach, die Cellawände und die Säulen des Pronaos.

Description: Bei dem Entwurf des dorischen Tempels wurden viele ionische Einflüsse verarbeitet. Er besitzt 6 x 13 Säulen (Stylobat 14,54 m x 32,88 m), deren Abstand zueinander an Front und Seiten gleich ist. Die Säulen sind nicht viel niedriger als die des älteren Heratempels, aber sie sind deutlich schlanker. Metopen- und Triglyphenbreite verhalten sich wie 5:3 zueinander, wobei keine Eckkontraktion durchgeführt wurde. Die Ostfront wurde dadurch betont, daß die Ringhalle hier 2 Joche und an den übrigen Seiten 1 Joch tief ist. Vor die Cella wurde eine 4 x 2-säulige Vorhalle gelegt. Es fehlt das Horizontalgeison des Giebels. Der Tempel wurde aus lokalem Muschelkalkstein errichtet, allerdings wurde die Triglyphen und die ionischen Profile aus Sandstein gefertigt. Die Bauteile waren stuckiert und bemalt. Gebäudetyp speziell: dorischer Peripteros

History:

Excavation: Die Tempel von Paestum wurden um 1750 wiederentdeckt.

Dating:

Description of the record display

Detailed information on the selected record is diplayed on the left side.

The header consists of an explicit serial number of the Arachne record, followed by a brief description. The information on the data record available in the database is found below the description.

If images are available for the record, they appear as thumbnails to the left next to the text information, with the respective negative number given below. These images can be enlargened by clicking on the thumbnail. Click on the negative number to view the image record, which shows additional information on the image.

The relationship of the record to other Arachne records can also be selected in the grey navigation bar.

Countries and Places

The browsing function provide here allows you a topographical access to the digitized titles of Classical Archaeology and Egyptology. The underlying georeferencings are based on the date of the geographical database GeoNames. As a rule the referencings are related on the present country and place names. Georeferencings are attributed to these titles, which refer to certain countries or places. On the other side also repositories as museum catalogues are connected to geocodes.
The both icons beside the titles as the 'Griffon' of the DAI and the logo of the Heidelberg University Library show you the provenance of the digitized title.

Information on building

Localization:

Paestum, Ancient place name: Poseidonia / Paestum, Italien, IT

Ort im Gazetteer

Geographical description:

Der Tempel liegt im Athenaheiligtum im nördlichen Bereich der Stadt.

Ancient landscape: Kampanien

Cultural era: griechisch

Characterization:

Building type: Tempel, Peripteros

Preservation: Die Peristase und der Architrav sind noch erhalten. Es fehlen das Dach, die Cellawände und die Säulen des Pronaos.

Description: Bei dem Entwurf des dorischen Tempels wurden viele ionische Einflüsse verarbeitet. Er besitzt 6 x 13 Säulen (Stylobat 14,54 m x 32,88 m), deren Abstand zueinander an Front und Seiten gleich ist. Die Säulen sind nicht viel niedriger als die des älteren Heratempels, aber sie sind deutlich schlanker. Metopen- und Triglyphenbreite verhalten sich wie 5:3 zueinander, wobei keine Eckkontraktion durchgeführt wurde. Die Ostfront wurde dadurch betont, daß die Ringhalle hier 2 Joche und an den übrigen Seiten 1 Joch tief ist. Vor die Cella wurde eine 4 x 2-säulige Vorhalle gelegt. Es fehlt das Horizontalgeison des Giebels. Der Tempel wurde aus lokalem Muschelkalkstein errichtet, allerdings wurde die Triglyphen und die ionischen Profile aus Sandstein gefertigt. Die Bauteile waren stuckiert und bemalt. Gebäudetyp speziell: dorischer Peripteros

History:

Excavation: Die Tempel von Paestum wurden um 1750 wiederentdeckt.

Dating:

Bauwerk: spätarchaisch.
